Milestone 3

Introduction

Anthropology focuses on the study of culture, identity, and social practice based on the experience of a population across time and space. Rituals offer meaning to a group, and they are the subject of anthropological inquiry. It is a means of transmitting the cultural values, to spread power, and is based on a consensus within a group, from birth to death. The Indus Valley Civilization is one of the oldest and most advanced urban societies in human history, existing between 2600 and 1900 BCE in the territories of present-day Pakistan and northwestern India. An anthropological perspective lets us know vital details of the early societies as to how they were socially, economically, and symbolically constructed (McCaffrey). The civilization of the Indus Valley, its material culture, and its ritual practices not only reveal technical expertise but also concern values and meanings that made up the collective identity of people.

Urban Planning as a Culture Reflection.

The well-organized city life is one of the largest aspects of the Indus Valley Civilization. Other cities, such as Mohenjo-Daro and Harappa, had standardized buildings made of bricks, grid-laid streets, and advanced drains. Planning of the civilization according to the anthropologists involves more than technical competence. It determines the preference of the people towards orderliness, sanitation, and the way they perceive health (Douglas-Jones et al. 13). In contrast to the elements of culture of the civilizations of Egypt and Sumerian, the Indus civilisation is founded on the premises of the egalitarian structure, which resulted in the development of the collective culture and distinct identity of the individuals.

Material Culture and Identity.

Sources found in the Indus Valley indicate the way in which individuals of the civilisation forged identity and lived life daily. Small stones carved delicately with animals and symbols were mainly used in trade, administration, and ceremonies. Other signs of shared cultures and cultural inventions include pottery, tools, and female statues (Boas et al. 18). The materials bear witness to unity: similar archeological objects extended across extensive spaces, bear testament to the ubiquitous nature of culture and differences within a territory, and indicate historical diversity at a local level (Oka 200). Such material culture is explained by anthropologists as not only being functional items, but they are cultural writings and carriers of beliefs, values, and social relations.

Ritual and Symbolism

Ritual practices may be investigated using archaeological evidence, even though their script has never been deciphered. The ritual baths, fire hollows, and statues reveal that spirituality has integrated itself into the life of the community on a permanent basis (Douglas-Jones et al. 14). Water that was a ritual practice may refer to purification and rebirth, and animal imagery has a sacred connotation. These were highly contextualized community ties that affiliated individuals to the surrounding (Landrum 43). The anthropologists make it clear that the ritual is not a mere ceremony that one does, but it is a ceremony that signifies symbolism in which identity is perceived over the decades.

Social Structure and Power

Although there is no sign of war and grandeur of rulers at the Indus Valley, the absence is a sign, inclined to conclude that power was vested in the ritual authority, non-government trade systems, or in group politics, as opposed to monarchical states (Landrum 55). Anthropological

evidence establishes the fact that the Indus Valley Civilization was not ruled by rulers, unlike early civilizations, which required great rulers to become successful (Barrett 48). The situation at the Indus Valley suggests otherwise: there may be an advanced society based on co-operation, equilibrium, and shared responsibility.

Transformations

Even though the civilization of the Indus Valley declined, the cultures of South Asia were impacted by it. Neither of the agricultural methods, settlement, nor symbols stayed the same as they progressively developed and became blended with other cultures, illustrating new manifestations. The discipline, anthropology, underlines the fact that culture does not remain the same; it takes some of its values but clears the way so that it can adapt to a new timeframe (Barrett 42). What is therefore wrong is to term the Indus Valley as a "lost" civilization because it is a foundational pillar that established and opened the doors for understanding region-wide identity and culture.

Conclusion

The Indus Valley Civilization that we know is a symbolic civilization. Its advanced urban design, as well as its material culture, ritual expression, and its characteristic system of power are just a few information that help human beings create and maintain social life (Chavarria 189). The Indus Valley can be considered a good example of human diversity and cultural creativity. With the help of anthropology, we can redefine this civilization as it first appeared as an archaeological site and transformed into a cultural system that is now a part of human history.
